CP4-27B4-10D

100 Gb/s CFP4 LR4 Transceiver

Feature

Compliant with 100GBASE-LR4 Support line rates from 103.125 Gbps to 111.81 Gbps Integrated LAN WDM TOSA / ROSA for up to 10 km reach over SMF Digital Diagnostics Monitoring Interface Duplex LC optical receptacle No external reference clock Single 3.3 V power supply Case operating temperature range:0°C to 70°C Power dissipation < 6W

Application

Local Area Network (LAN) Data Center Ethernet switches and router applications

General Description

100G CFP4 LR4 optical Transceiver integrates receiver and transmitter path on one module. In the transmit side, four lanes of serial data streams are recovered, retimed, and passed to four laser drivers. The laser drivers control four EMLs (Electric-absorption Modulated Lasers) with center wavelength of 1296 nm, 1300nm, 1305nm and 1309 nm. The optical signals are multiplexed to a single –mode fiber through an industry standard LC connector. In the receive side, the four lanes of optical data streams are optically de-multiplexed by the integrated optical de-multiplexer. Each data stream is recovered by a PIN photo-detector and trans-impedance amplifier, retimed. This module features a hot-pluggable electrical interface, low power consumption and MDIO management interface.

The module provides an aggregated signaling rate from 103.125 Gbps to 111.81 Gbps. It is compliant with IEEE 802.3 ba 100GBASE-LR4 and ITU-T G.959.1, and OIF CEI-28G-VSR. The MDIO management

interface complies with IEEE 802.3 Clause 45 standard. The transceiver complies with CFP MSA CFP4 Hardware Specification, CFP MSA Management Interface Specification, and OIF CEI-28G-VSR standards. A block diagram is shown in Figure 1.

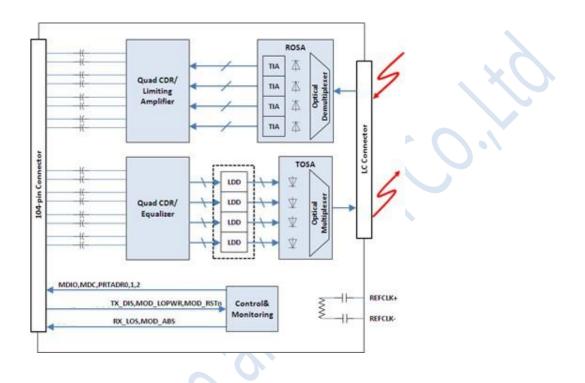

Figure 1. CFP4 LR4 Optical Transceiver functional block diagram

Transmitter

The transmitter path converts four lanes of serial NRZ electrical data from line rate of 25.78 Gbps to 27.95 Gbps to a standard compliant optical signal. Each signal path accepts a 100 Ω differential 100 mV peak-to-peak to 900 mV peak-to-peak 25 Gbps electrical signal on TDxn and TDxp pins. Inside the module, each differential pair of electric signals is input to a CDR (clock-data recovery) chip. The recovered and retimed signals are then passed to a laser driver which transforms the small swing voltage to an output modulation that drives a EML laser. The laser drivers control four EMLs with center wavelengths of 1295.56 nm, 1300.05 nm, 1304.58 nm and 1309.14 nm. The optical signals from the four lasers are multiplexed together optically. The combined optical signals are coupled to single-mode optical fiber through an industry standard LC optical connector.

Receiver

The receiver takes incoming combined four lanes optical data from line rate of 25.78 Gbps to 27.95 Gbps through an industry standard LC optical connector. The four incoming wavelengths are separated by an optical de-multiplexer into four separated channels. Each output is coupled to a PIN photo-detector. The electrical currents from each PIN photo-detector are converted to a voltage with a high-gain trans-impedance

amplifier. The electrical output is recovered and retimed by the CDR chip. The four lanes of reshaped electrical signals are output to RDxp and RDxn pins.

Low Speed Signaling

Low speed signaling is based on low voltage CMOS (LVCMOS) operating at a nominal voltage of 3.3 V for the control and alarm signals, and at a nominal voltage of 1.2 V for MDIO address, clock and data signals. All low speed inputs and outputs are based on the CFP MSA CFP4 Hardware Specification and CFP MSA Management Interface Specification.

MDC/MDIO: Management interface clock and data lines.

PRTADR0, 1, 2: Input pins. MDIO physical port addresses.

GLB_ALEMn: Output pin. When asserted low indicates that the module has detected an alarm condition in any MDIO alarm register.

TX_Disable: Input pin. When asserted high or left open the transmitter output is turned off. When Tx_Dsiable is asserted low or grounded the module transmitter is operating normally. Pulled up with 4.7 k Ω to 10 k Ω resistors to 3.3 V inside the CFP4 module.

MOD_LOPWR: Input pin. When asserted high or left open the CFP4 module is in low power mode. When asserted low or grounded the module is operating normally. Pulled up with 4.7 k Ω to 10 k Ω resistors to 3.3 V inside the CFP4 module.

MOD_RSTn: Input pin. When asserted low or grounded the module is in Reset mode. When asserted high or left open the CFP4 module is operating normally after an initialization process. Pulled down with 4.7 k Ω to 10 k Ω resistors to ground inside the CFP4 module.

Mod_ABS: Output pin. Asserted high when the CFP4 module is absent and is pulled low when the CFP4 module is inserted.

RX_LOS: Output pin. Asserted high when insufficient optical power for reliable signal reception is received.

High Speed Electrical Specifications

		*									
Parameter	Symbol	Min	Max	Unit	Notes						
Transmitter electrical input from host											
Differential voltage pk-pk			900	mV							
Common mode noise (rms)			17.5	mV							
Differential termination mismatch			10	%							
Transition time		10		ps	20/80%						
Common mode voltage		-0.3	2.8	V							
Receiver electrical output to host											
Differential voltage pk-pk			900	mV							
Common mode noise (rms)			17.5	mV							
Differential termination mismatch			10	%							
Transition time		9.5		ps	20/80%

MDIO Management Interface

The HC CFP4 Optical Transceiver incorporates MDIO management interface which is used for serial ID, digital diagnostics, and certain control and status report functions. The CFP4 transceiver supports MDIO pages 8000h NVR 1 Based ID registers, 8080h NVR 2 Extended ID registers, 8100h NVR 3 network lane specific registers , 8180h NVR 4 registers ,and pages A000h module VR 1 registers, A180h NVR 4 registers), A200h network lane VR 1 registers, A280h network lane VR 2 registers, A400h host lane VR1 specific registers.

Details of the protocol and interface are explicitly described in CFP MSA Management Interface Specification. Please refer to the specifications for design reference.

Parameter	Symbol	Min	Тур.	Max	Unit	Notes
Signaling rate, each lane		0	25.78125		Gbps	
		1294.53	1295.56	1296.5 9	nm	
Lane wavelength (range)	· C	1299.02	1300.05	1301.0 9	nm	
Lane wavelength (Tange)		1303.54	1304.58	1305.6 3	nm	
		1308.09	1309.14	1310.1 9	nm	
Rate tolerance		-100		100	ppm	From normal rate
Side-mode suppression ratio	SMSR	30			dB	
Total launch power				10.5	dBm	
Average launch power, each lane	Pavg	-4.3		4.5	dBm	
Extinction Ratio	ER	4			dB	
Optical modulation amplitude, each lane (OMA)	OMA	-1.3		4.5	dBm	

Optical Transmitter Characteristics

Difference in launch power between any two lanes (OMA)				5	dB				
Transmitter and Dispersion Penalty, each lane	TDP			2.2	dB				
Average launch power of OFF transmitter, each lane				-30	dBm	Sx C			
Relative Intensity Noise	RIN ₂₀ O MA			-130	dB/Hz				
Transmitter reflectance				-12	dB	0.1			
Transmitter eye mask {X1, X2, X3, Y1, Y2, Y3}		{0.25, 0.4	, 0.45, 0.25, (5				
X3, Y1, Y2, Y3} Optical Receiver Characteristics									

Optical Receiver Characteristics

Parameter	Symbol	Min	Тур.	Max	Unit	Notes
Signaling rate, each lane			25.78125		Gbps	
Rate tolerance		-100		100	ppm	From normal rate
Average receive power, each lane	Pavg	-10.6		4.5	dBm	
Receive max power, each lane (OMA)	S	· ·		4.5	dBm	
Difference in launch power between any two lanes (OMA)	6			5.5	dB	
Receiver Sensitivity (OMA), each lane	Rsen			-8.6	dBm	1
Stressed Receiver Sensitivity (OMA), each lane	SRS			-6.8	dBm	
	Stressed	receiver sens	sitivity test co	nditions		
Vertical eye closure penalty, each lane	VECP		1.8		dB	
Stressed sys J2 jitter, each lane	J2		0.3		UI	2

HC Optical Science and Tech Co., Ltd. 100 Gb/s CFP4 LR4 Transceiver

Stressed sys J9 jitter,	J9		0.47		UI	2
each lane			0.47		01	2
Receiver reflectance				-26	dB	
LOS Assert	LOSA	-30			dBm	
LOS De-assert	LOSD			-12	dBm	•
LOS Hysteresis		0.5		4	dB	

1. Receiver sensitivity (OMA), each lane, is informative.

2. Vertical eye closure penalty, stressed eye J2 Jitter, and stressed eye J9 Jitter are test conditions for measuring stressed receiver sensitivity. They are not characteristics of the receiver.

Lower Memory Map

The lower 128 bytes of the 2-wire serial bus address space, see Table 1, is used to access a variety of measurements and diagnostic functions, a set of control functions, and a means to select which of the various upper memory map pages are accessed on subsequent reads. This portion of the address space is always directly addressable and thus is chosen for monitoring and control functions that may need to be repeatedly accessed. The definition of identifier field is the same as page 00h Byte 128.

Byte Address	Description	Туре		
0	Identifier (1 Byte)	Read-Only		
1-2	Status (2 Bytes)	Read-Only		
3-21	Interrupt Flags (19 Bytes)	Read-Only		
22-33	Module Monitors (12 Bytes)	Read-Only		
34-81	Channel Monitors (48 Bytes)	Read-Only		
82-85	Reserved (4 Bytes)	Read-Only		
86-97	Control (12 Bytes)	Read/Write		
98-99	Reserved (2 Bytes)	Read/Write		
100-106	Module and Channel Masks (7 Bytes)	Read/Write		
107-118	Reserved (12 Bytes)	Read/Write		
119-122	Password Change Entry Area (optional) (4 Bytes)	Read/Write		
123-126	Password Entry Area (optional) (4 Bytes)	Read/Write		
127	Page Select Byte	Read/Write
